

Forest Sanctuary

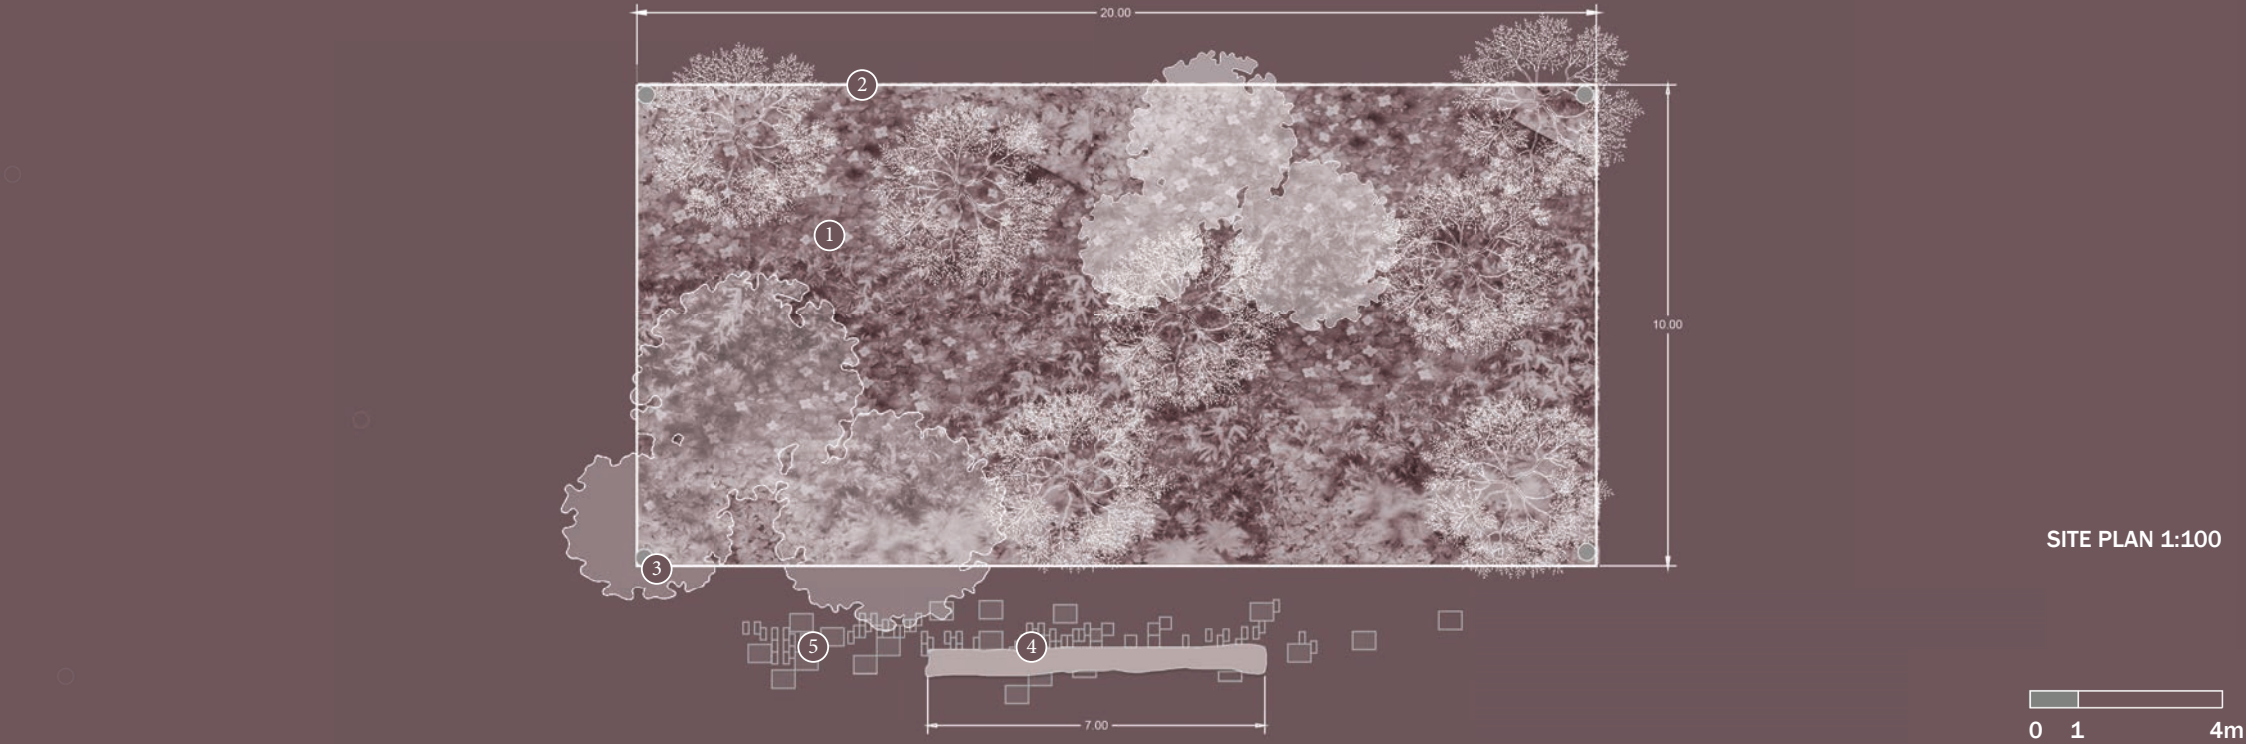

Is it possible to enclose a portion of the forest? Can it be preserved and allowed to evolve naturally without any human interventions?

The main design drive is to reveal the magnificence of nature, celebrating the diverse beauty of the wilderness.

This proposal shields the portion of the Canadian forest from the impact of human access. The forest takes center stage, while visitors becoming viewers and its stewards. The white threads are separating people and the forest. Within this sanctuary, visitors bear witness to a fragment of woodland, observing its seasonal symphony as a captivating life story unfolds before their eyes. Birds, bees, beetles, snails, and other wildlife inhabit this territory. Nature follows its own course, supporting the natural ecology of the forest

This space stands as the antithesis of a garden, representing a different realm. Here, the forest displays its identity and is granted the right to exist on its own terms.
