

# garden chapel

With the rapid development of industry, technology, and science in the 20th century, we entered the 21st century without sufficient opportunities to connect with nature. Threats to both humans and nature, such as pandemics, AI, and climate change, necessitate that humans take a pause to reconnect with the natural world.

In response, we propose a chapel made of affordable materials designed to provide solace to the distressed human spirit. Natural light cascades from the polycarbonate skylight, illuminating the simple yet profound weight of the concrete blocks. Additionally, natural-colored light filters through the gaps between the walls, creating a serene atmosphere. Scaffolding not only provides structural rigidity but also integrates with the skylight structure.

Beneath the small and simple chapel, there are seats where people can gather, fostering moments of quiet relaxation.
