

EXCRETA

PROJECT DESCRIPTION:

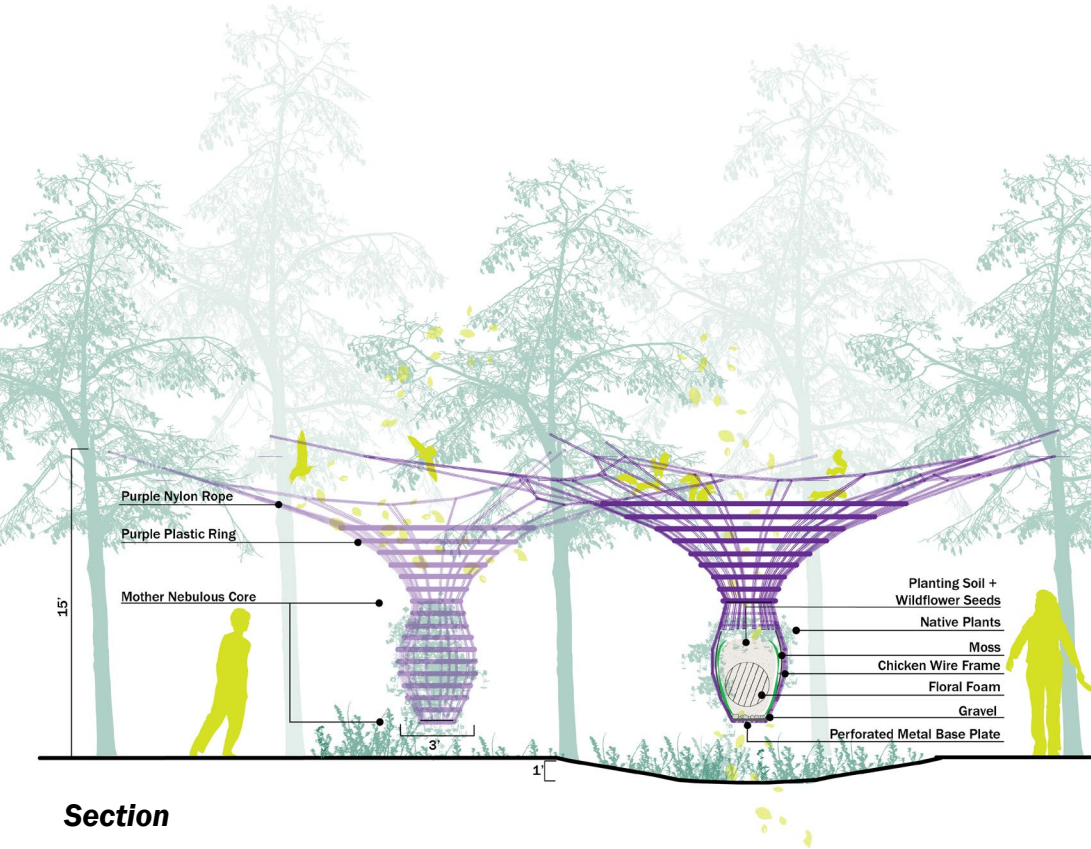

Excreta is an alien nebulous of maternal nature energy, brought to earth to feed and nourish the forest. Tethering herself to the surrounding trees, her elongated form funnels the fallen leaves and wastes of forest critters down into the mother nebulous. Her bulbous core filled with native plants and wildflower seeds, she absorbs the nutrients of her surroundings and excretes them into a bursting array of ecological energy, a microclimate dripping from her core. The winds, rains and animals feed, and are fed by the mother nebulous and she transforms and releases their energy as a spontaneous, unpredictable wilding of the surroundings. Excreta re-emerges post-winter hibernation, bursting with spring blooms seeping from within, her transformative energy revealed by spontaneous bouquets of wildflowers that emerge and blanket the fresh grounds around her.
