

biome safari

Biome Safari invites visitors into a juxtaposed garden of hybrid ecosystems. Within the frame of the garden, heterogeneous plants and environments from different climatic zones coexist together at different heights. The center of the greenhouse, where the rain-forest microclimate and plants can be observed and penetrated, is surrounded by a low, humid garden of rocks, mosses, and ferns. An air plant suspended from a black rubber band and a garden layer of dry ground and garden elements symbolize the unfamiliar arid region and provide an opportunity to wander. Finally, the outermost level of the garden, framed by native Spruce trees, cleverly conceals and opens up the layers of habitat, providing an entry experience and a dramatic contrast to the local ecosystem. We invite you to enter the garden and realize that we are all connected to and neighboring different ecosystems.
