

SPROUTING BEYOND TERRAINS

Borders in nature are ever-changing. Ridges and valleys, in particular, created by the elevation of the terrain, are home to many species of plants and animals. With this garden, we propose to experience the diverse borders of nature.

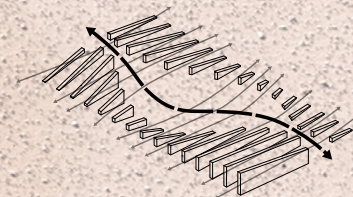

We begin by setting up habitats of different microclimates with the earthwork of the site. Then, through a central pathway and a series of translucent walls that divide and experience the dynamic nature created, we provide the experience of rising and falling, tension and relaxation, overlap and penetration, on a human scale, that can be felt at a natural border. On top of this physical setting, a time axis that envisions the maturation of the garden as it will be realized across the border of a few months from its beginning. The garden sprouts and grows on a natural border, and eventually transcends it.

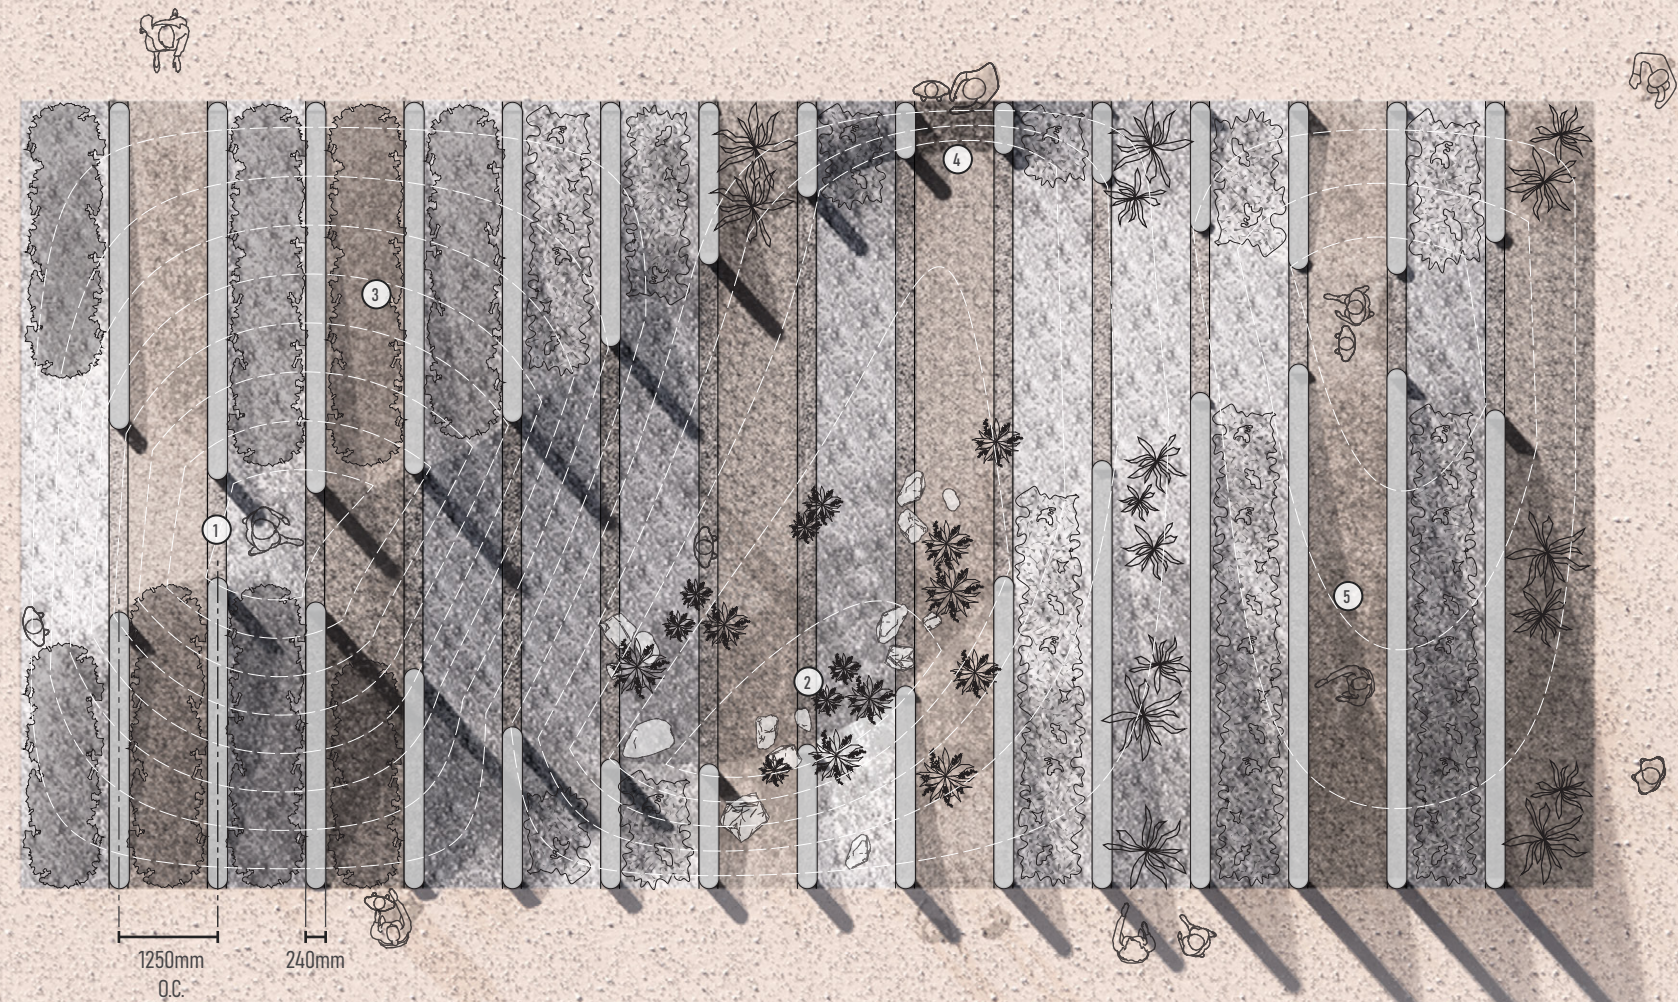

Ascending + Descending

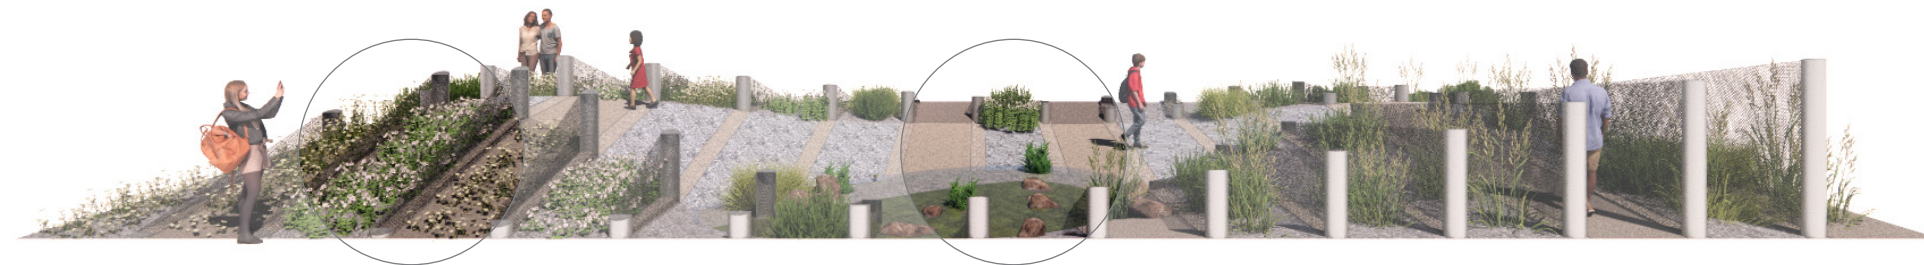

Squeezing + Releasing

layering + subdividing
